

AJAX: Topic Exploration

- AJAX is an acronym for Asynchronous JavaScript and XML
- By exchanging small amounts of data with the server, AJAX updates the web page asynchronously. Meaning it is possible to update parts of a web page, without having to reloading the whole page.

- http://www.w3schools.com/ajax/ajax_intro.asp

```
<!DOCTYPE html>
<html>
<body>

<div id="myDiv"><h2>Let AJAX change this text</h2></div>
<button type="button" onclick="loadXMLDoc()">Change
Content</button>

</body>
</html>
```

In this code when the button “myDiv” is called it will call the method “loadXMLDoc()”. Then in between the <script> tags, the “loadXMLDoc()” method would be located there.

- All modern browsers support the XMLHttpRequest object
